

There are some powerful reasons to use **ui-router** over **ngRoute**:

1. It is used for large application where the user have many pages and that are inheriting from different section. So ui-router is used for the nesting views.
2. It allows the user to have a strong linking between the state. So on changing the url in a particular place, it will update every link to that state.
3. User can also pass information between states with the help of `$stateParams`.
